Problem Statement / Definition

- **Domain:** Machine Learning
- **What:** Anomaly detection in large datasets
- **How:** One-class SVM for anomaly detection
- **Data:** Operational sensor dataset

Overview

- 1 Introduction
 - Problem Statement
 - Details
- 2 Literature Survey
- 3 Methodology
 - High Level design
 - Dataset
 - Implementation
- 4 Results
- 5 Hardware and Software requirements
- 6 Time line

Motivation

- IoT devices may not be in working condition
- Final result may vary if an IoT device fails
- Loss of money and time if project fails only because of failure of an IoT device

We want to build a project that alleviates these issues by better detecting and analyzing the anomalies

What are we doing?

- Implement an ML-based solution for detection of anomalies and also show the anomalies detected.
- **Idea:** Our initial focus is to detect anomalies in IoT data. We then want output the health of the IoT device.

Literature Survey

- Anomaly detection with event data in the Internet of Things :- Multidimensional scaling algorithm used to detect anomalies
- Anomaly detection and monitoring in Internet of Things communication :- A multi-platform monitoring and anomaly detection system that supports heterogeneous devices.
- Anomaly detection using machine learning using a case study :- Performance criteria used in anomaly detection based on mathematical statistics to specify boundaries in emerging applications used in the world.
- Fog-Empowered Anomaly detection in IoT using Hyperellipsoidal clustering :- Hyperellipsoidal clustering to detect anomalies
- Detecting malicious anomalies in IoT :- Performance of ensemble learners on incomplete IoT intrusion datasets, represented by point anomalies
- Information Visualization and Visual Data Mining :- Several algorithms to visualize data

Advantages and Disadvantages

Advantages :

- A non-technical person can still identify the health of an IoT device irrespective of his knowledge in IoT devices
- While ML and AI can help to make sense of data, it still requires an analyst

Disadvantages :

- Lot of historic operational data is required

2 phases of our project:

- Detection of anomalies : Anomaly detection done using historic operational data using One-class SVM
- Visualization of the results : The anomalies are displayed in the form of a scatter plot

Figure: Flowchart

- Unsupervised algorithm, that learns the decision function to find anomalies
- This function is used to classify new data, whether it belongs to or is different from the dataset
- Tries to fit a hyper-sphere, that includes most of the training samples
- Main issue: The dataset has to be free from outliers

Implementation - Code snippets

```
1 import pandas as pd
2 import numpy as np
3 import matplotlib.pyplot as plt
4 from sklearn.svm import OneClassSVM
5 from sklearn.model_selection import train_test_split
6 from sklearn import preprocessing
7 from sklearn.covariance import EllipticEnvelope
8 from IPython.display import display
9
10 #method 1 to detect outliers
11 def ellipticCurve(dataset):
12     classifier = EllipticEnvelope(contamination = outlierFraction)
13     classifier.fit(dataset)
14     predScore = classifier.decision_function(dataset)
15     pred = classifier.predict(dataset)
16     outlierRows = [i for i in range(len(pred)) if pred[i]==-1]
17     return predScore, outlierRows
18
19 #method 2 to detect outliers
20 def oneClassSVM(dataset):
21     classifier = OneClassSVM(nu = outlierFraction, gamma = 0.03)
22     classifier.fit(dataset)
23     predScore = classifier.decision_function(dataset).T[0]
24     pred = classifier.predict(dataset)
25     outlierRows = [i for i in range(len(pred)) if pred[i]==-1]
26     return predScore, outlierRows
27
28 df = pd.read_csv("./preprocessed.csv")
29 beaches = list(df["BeachName"].unique())
30 numBeaches = len(beaches)
31
32 cols = list(df.columns)
33 colSize = len(cols)
34 noStrCols = cols
35 del(noStrCols[1])
36 del(noStrCols[6])
```

Implementation - Code snippets

```
58 for beach in beaches:
59     csvName = "Beach"+str(beach)+".csv"
60     dfDic[beach] = pd.read_csv(csvName)
61
62 colsToAnalyze = noStrCols
63 numRows = {}
64 for i in range(0, numBeaches, 1):
65     numRows[i] = dfDic[i].shape[0]
66
67 outlierFraction = 0.01
68 ran = np.random.RandomState(123)
69 #anomalyList = ["ellCurve", "svm"]
70 anomalyList = ["svm"]
71
72 #dfDic[beach]['Turbidity']
73
74 predictions = {}
75 for beach, data in divideByBeachName.items():
76     predictions[beach] = {}
77
78     for x in noStrCols:
79         s, o = oneClassSVM(np.reshape(dfDic[beach][x], (-1, 1)))
80         predictions[beach][x] = {"ScorePred":s, "outliers":o}
81
82 statsCols = ["BeachName", "dataSize", "normals", "anomalies", "anomaliesRate"]
83 outliers = {}
84
85 for index in beaches:
86     outliers[index] = {}
87
88 for x in noStrCols:
89     dataSize = []
90     oks = []
91     ngs = []
92     ngRate = []
93     for i in range(0, len(beaches)):
```
